

xLobby Cube External Storage Options

NAS systems are networked appliances which contain hard drives that are accessible from your home network. More than one NAS drive can be connected to your network for increased storage capacity as needed without limitations. This type of setup is preferred if more than one xLobby Cube is connected to the network for sharing out of media content folders. Network-attached storage removes the responsibility and complications associated with file serving media content from other xLobby cubes on the network. To add and setup these types of drives goto the Help Menu, select **Setup**, then select **Storage Add** and follow the steps for making NAS drives available for use with the any xLobby Cube on the network.

USB Hard drives connect directly to the xLobby Cubes 2 x rear USB jacks. To add and setup these types of drives goto the Help Menu, select **Setup**, then Select **Storage Add** and follow the steps for making the drives available for use with the xLobby Cube. If more storage capacity is required you can use a USB 2.0 hub to expand the USB ports to add more drives. If you plan on constantly expanding or adding more storage to your system then we recommend the NAS solution to increase your storage requirements.
